AIRUNO
DESIGNER COOKER HOODS

CONTENTS

www.airuno.co.uk

INTRODUCTION

Air Uno was established in 2008 to distribute upmarket Italian designer cooker hoods.

The aim was to create a unique range of products which combined quality and efficiency with innovation.

Various creative options will satisfy the important issues for you in both design and performance.

The hoods fall into several groupings as follows:

Sophisticated **COUNTER EXTRACTORS** that extract fumes directly from the hob at the same level.

Sleek **DOWNDRAFTS** that disappear when not in use.

Unobtrusive **CEILING HOODS** that gives an attractive appearance of lighting while performing extraction extremely well.

CUPBOARD HOODS which means that the kitchen retains the clean lines that you wish to achieve.

A variety of well designed **WALL HOODS** in stainless steel, black or white glass which allows the choice of many styles.

Stunning **ISLAND HOODS** that compliments your kitchen by making your individual statement.

All our **MOTORS** give you the choice of power to suit your style of living and cooking.

COMPAIR® DUCTING which will maintain the power of all our extractors, reducing the noise level and saving energy.

We provide cooker hoods of top quality which are ex-stock for next day delivery.

Our after sales service is by our own engineer who is always available for technical advice.

designer cooker hoods with a difference

AIRUNO | designer cooker hoods with a difference

HOW TO CHOOSE A COOKER HOOD

Step 01. You need to determine the amount of air that the cooker hood needs to extract all the fumes, steam and odours
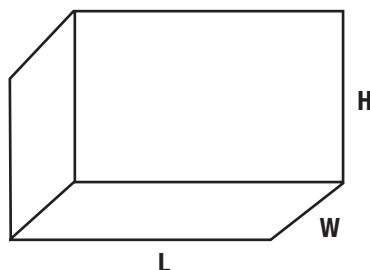

i.e. cubic metres per hour = m^3/h.

Establish the measurement of the kitchen length x width x height.

e.g. 5 metres long (L) x 4 metres wide (W) x 2.5 metres high (H) = 50 cubic metres.

One needs at least 10 changes of air per hour.

50 cubic metres x 10 = 500 cubic metres per hour.

H

W

L

You have now established that your kitchen needs a cooker hood with an airflow of at least 500 cubic meters per hour = 500 m^3/h.

Step 02. You now need to choose the type of cooker hood suitable for your kitchen as well as keeping the airflow in mind.

Your kitchen dealer will help you in this matter and they will tell you the type of cooker hood you need.

i.e. **Downdraft - Ceiling Hood - Undermount Cupboard Hood - Wall Hood - Island Hood**

Your choice requires you now to decide on a cooker hood which aesthetically matches your kitchen as well as being the correct size for the hob and also the airflow to keep your kitchen free from fumes, steam and odours.

There is a wide variety of cooker hoods on the market and it is wise to choose a hood more powerful than necessary which will enable it to run at lower speed increasing the efficiency and reducing the noise.

It is also important to make sure the ducting is correctly designed and installed so that the full power of the motor in the cooker hood is maintained.

We recommend you choose rigid ducting either 150mm diameter or 2220mm x 90mm with as few bends as possible.

It is also important to make sure the ducting is correctly designed and installed so that the power of the motor in the cooker hood is maintained.

FREQUENTLY ASKED QUESTIONS

01. What size motor do I need?

This depends on the size of your kitchen. See Step 01 on how to choose your cooker hood.

02. Can the hood recirculate the air?

Yes. All Air Uno hoods have the option to be re-circulating but you will need to use charcoal filters as these help to absorb the odours.

03. What size ducting should be used?

We recommend using no less than 150mm diameter or the equivalent rectangular - less than this will lead to loss of power of the extraction.

04. What height should the cooker hood be installed above the hob?

See individual product details.

05. Which model of hood can be used with an external motor?

Our full range of motors including our external model are compatible with every Air Uno extractor.

06. How far can the remote and external motors be positioned from the cooker hood?

All Air Uno motors i.e. AMR, AMF and AME come with a 10 metre long cable.

07. Can a gas hob be used with a downdraft?

Only the Elektra, Parsifal and Zaira downdraft models can be used with a gas hob.

08. How long is the warranty?

Our warranty is for 2 years and covers all parts and labour.

09. Where can you purchase an Air Uno cooker hood?

You can purchase from one of our recommended dealers which are listed on our website at www.airuno.co.uk.

10. What is the delivery time?

We deliver within 2-3 working days.

11. Motors - Can inline motors be installed outside?

No. The only motor that should be installed outside is our AME12 external motor.

12. Questions about the Chopin and Bach

How far away should the Chopin/Bach extractors be from the hob?

No gap must be left.

What are carbon pellets for?

Carbon pellets are for use with a recirculation kit.

Can you use the recirculation kit with the silent kit?

Yes you can use both together, but the recirculation kit takes up a lot of space, so place the motor which is approximately 150mm high under the plinth.

Where do you put the ducting for the Chopin?

You connect the ducting to the underside of the Chopin, and then connect it to the top of the plinth motor using a converter kit, and from there to the outside.

13. Questions about the Elektra

Where do you attach the ducting to the attached motor?

You attach the ducting on the top or the bottom of the motor.

What ducting do you use if you duct straight from the extractor?

We recommend using the Compair® ducting.

14. Questions about the Otello

Which motor is included in the price of the Otello?

The H850 motor is included in the price.

**What is the difference between the hood with motor and without motor?**

The hood without the motor needs a remote or external motor.

THE **COMPAIR**® EXTRACTION SYSTEM
FOR USE WITH COOKER HOODS
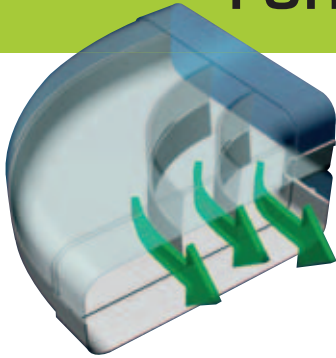

The patented system comprises guide vanes integrated into the bends which reduces the turbulence of air that builds up in the bend.

The power of extraction is maintained thus adding to the effectiveness of the cooker hood.

The noise level is reduced… there is a saving in energy.

Example of bends

Deflector

Horizontal bend
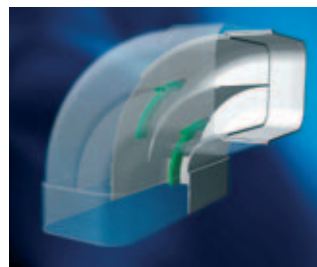

Vertical bend

Round tube bend

The integrated guide vane technology stabilises the airflow in the duct and guides it outside without any loss of pressure.

The **COMPAIR**® Automatic Wall Vent

- **No external power is required.**
- **The wall vent operates by the airflow when the cooker hood is operating.**
- **The closing of the wall vent is by spring and magnets spring loaded for tight seal which stops cold air coming into the kitchen.**
- **Good seal when hood is switched off.**
- **Opens and closes automatically.**
- **An all round seal prevents heat loss thus saving heat energy.**
